Bhutan

2021

FOREWORD

The National Health Accounts (NHA) exercise is a major periodic initiative of the Policy and Planning Division, Ministry of Health(MoH) to track overall health expenditure and flow of resources in the health sector. The NHA exercise provides a detailed analysis of expenditure data of the government, out of pocket (household expenditure on health), development assistance to the health sector as well as private employer's expenditure on health. The exercise was carried out in accordance with the World Health Organization's System of Health Accounts (SHA 2011) tool.

This report provides necessary evidence which is critical for the formulation of health financing and resource mobilization for strategic health investment. The NHA also contributes to evidence-based decision making and enhances transparency and efficiency in health expenditure management.

This exercise was conducted by a team led by the Policy and Planning Division in collaboration with key government agencies including JDWNRH, line departments under MoH and the Ministry of Finance. The National Health Accounts exercise involved extensive consultations with the government sectors and agencies, corporations and development partners and CSOs.

The technical and financial support of the World Health Organization (WHO) was invaluable as MoH strives to institutionalize and conduct NHA on a routine basis.

The Ministry of Health would like to acknowledge the work and dedication of the team in the development of this report. The NHA report along with the previous editions will assist the Ministry of Health and other stakeholders to ascertain sources of funds and utilization trends in the health sector over the years. The MOH is hopeful that the findings from this exercise will be effectively utilized by all the stakeholders to pave the way towards Bhutan's quest for achieving Universal Health Coverage.

(Dr Pandup Tshering) Secretary Ministry of Health

Acknowledgement

The 2021 National Health Account exercise was developed through a rigorous consultative process at national and regional level facilitated by WHO Country Office. Despite COVID-19 pandemic and other limitations, it was made possible under the strong leadership and stewardship of the MoH and key stakeholders. The MoH acknowledges in particular the continued technical and financial support of WHO in the production of Bhutan's NHA reports.

The Policy and Planning Division, Ministry of Health commends the efforts of the following NHA Core Team members for their unrelenting efforts in ensuring the production of this report:

- 1. Mr. Tashi Penjor, Chief Planning Officer, MOH.
- 2. Mr.Kinley, Chief Finance Officer, JDWNRH.
- 3. Mr.Ugyen Penjore, Sr.Medical Record Officer, JDWNRH.
- 4. Mr.Pemba, Sr.Program Officer, EMTD, Department of Medical Services, MOH.
- 5. Mr.Sonam Tashi, Sr.Finance Officer, Directorate of Services, MOH.
- 6. Mr.Kinley Dorjee, Research Officer, Policy and Planning Division, MOH.
- 7. Mr.Sonam Wangdi, Dy. Chief Planning Officer, Policy and Planning Division, MOH.
- 8. Mr.Tandin Dendup, Sr.Planning Officer, Policy and Planning Division, MOH.
- 9. Mr. Sonam Phuntsho, Policy and Planning Division, MOH. (Focal for NHA)
- 10. Mr.Tshering Wangdi, Policy and Planning Division, MOH.(Focal for NHA)

The MoH would like to extend special appreciation to Dr.Neil Thalagala, WHO consultant, who has not only facilitated the production of a series of NHA for Bhutan but also built the local capacity on the NHA.

The Ministry of Health also would like to thank all the relevant government agencies, financial and corporate institutions, CSOs and private sectors for rendering their support in sourcing data for the NHA exercise.

The Minitry of Health would like to acknowledge support of Mr.Chana Singye IT professional in Health Promotion division for the design and layout of the report.

Executive summary

This report presents the findings of the National Health Accounts (NHAs) studies of Bhutan for the Financial Year (FY) 2018-2019 and 2019-2020. The NHA describes the financial flows related to current and capital expenditures incurred by the government, households, donors, employers, and health insurers in the country to meet the health care needs of residents in Bhutan during the two financial years.

The exercise estimated the total national health expenditures and disaggregated them into 13 different classifications covering consumer, provider, and financial interfaces. The study was conducted using the System of Health Accounts (SHA) 2011 of the World Health Organization (WHO).

The total Current Health Expenditures (CHE) for FY 2018/19 and FY 2019/20 were Nu. 6233 million (mn) and Nu. 7656 mn, respectively. These amounts include the expenditures made by government, corporate and household during respective fiscal years including the cost of capital assets consumption in the health system. The contribution of the Royal Government of Bhutan (RGoB) on CHE was around 3 % of the Gross Domestic Product (GDP).

The expenditure on the capital formation (CF) in FY 2018/19 and 2019/20 accounted for Nu. 979 mn and Nu.1048 mn respectively.

The total sum of CHE and CF during the FY 2018/19 was Nu. 7212 mn while it was Nu. 8705 mn for FY 2019/20. This accounts to approximately 4% and 4.5% of the GDP in respective financial years.

Inpatient care was the main cost driver which constituted about 38% (2018/19) and 41% (2019/20) of the CHE followed by outpatient care constituting 15% and 14% in respective years. Preventive care costs accounted for around 14% of CHE. The other health care functions such as ancillary services including laboratory investigations, and purchasing medical goods constitute 33% and 31% of the total CHE in the respective FYs.

The largest share of CHE was attributed to Non-Communicable diseases accounting for 34% and 41% of CHE in respective FY. The second highest CHE was incurred for managing reproductive health-related conditions that consumed 23% and 22% of CHE in each FY.

Among the districts, the highest CHE was incurred in Thimphu (34% in FY 2018/19 and 34.5% in FY 2019/20) followed by Sarpang (9.1% in FY 2018/19 and 9.4% in FY 2019/20). The lowest CHE was incurred by Gasa with 0.6% in both the FYs. The health facilities were identified as the most cost-consuming in both financial years with 60.5% and 61.1% in the respective FYs as compared to providers of ambulatory care and preventive services.

Nearly 40% of CHE were spent on materials and services (curative and diagnostic services, medical supplies and training of healthcare workers) related to health care provision in both financial years followed by expenditures on employees pay, allowances and other benefits (30% in FY 2018/19 and 36% in FY 2019/20). The RGoB's share of CHE was estimated at 70% and 73% of CHE in FY 2018/19 and 2019/20 respectively. Households' contribution to CHE was around 18% in FY 2018/19 and 15% in FY 2019/20. The contribution from the external sources was around 7% and 5 % of CHE in FY 2018/19 and 2019/20 respectively.

The central government expenditures scheme constituted 60% and 61% of CHE while the Dzongkhag health sector scheme accounted for around 17% and 19% in FY 2018/19 and 2019/20. Insurance schemes covered only a smaller share (0.2 %) of CHE in two financial years.

1. BACKGROUND

The Ministry of Health has been conducting National Health Accounts (NHA) studies for consecutive financial years since FY 2009-10. This report presents the findings of the NHA studies conducted for the FY 2018/19 and FY 2019/20. This NHA is an exercise carried out to determine the country's health expenditure to meet the health care needs of residents and to describe those expenditures in various financial sources, provider and consumer perspectives.

This NHA report includes the analyses of health expenditures for FY 2018/19 & 2019/20. The health expenditures are categorized into three interfaces such as financial interface, provider interface and consumer interface with over 13 different financing classifications.

This report aims to answer the following:

- Distribution of health expenditures among various health care functions, genders of different ages and people with different illnesses/health conditions.
- Types of health services provided by the facilities and proportion of health care expenditures expended.
- Details on the health funding sources, distribution channels and delivery of the health services from different health care settings during the two FYs.

1.1. Health Care Financing System in Bhutan

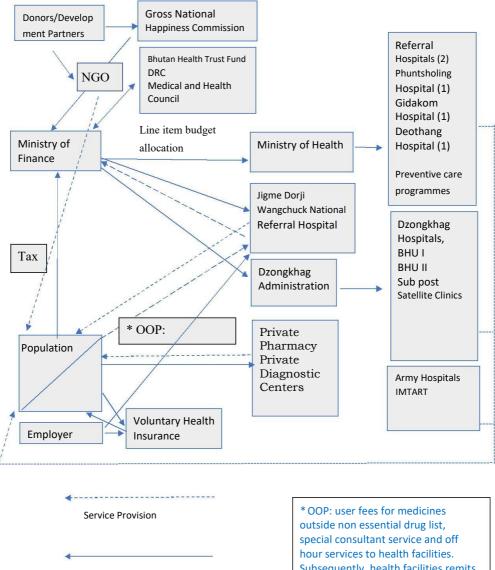

Health care in Bhutan is predominantly funded and managed by the State. It is delivered through a three-tiered network of health facilities across the country in line with the service standards and levels of care. This is in accordance with Article 9, Section 21 of the Constitution of the Kingdom of Bhutan, which states that "The state shall provide free access to basic public health services in both modern and traditional medicines". Currently, there are 49 sub posts and 185 Basic Health Units (BHU) II at primary level, 25 BHU I and 30 hospitals at secondary and 3 referral hospitals at the tertiary care.

Around 95% of the Bhutanese population live within the 3 hours distance to the nearest health facility (MoH, 2012). Both the modern and traditional health services are integrated into the health system. Patients requiring specialized health services, which are not available in the country are referred outside Bhutan at the cost of the government. However, the public health service does

not include services such as private cabin facility at the government hospitals, cosmetic (high-end) dental care, and cost for obtaining medical certificates and drugs outside the national essential drug list. The private provider participation in the healthcare system is limited to a few pharmacies and selective diagnostic centers.

Figure 1 illustrates the flow of funds from the Ministry of Finance (MoF), individuals, development partners, including Bhutan Health Trust Fund (BHTF), and employers to the service providers. The flow of funds from MoF to the public health facilities is channeled through the financial intermediaries; Ministry of Health (MoH), JDWNRH)1, and local government administration. Purchasing of public health services is carried out by the MoF through line-item budgets, based on historical trends and realities. The only voluntary private health insurance firm, Royal Insurance Corporation of Bhutan Ltd (RICB) usually reimburses the patients. Households also pay directly for availing services from the private pharmacies, private diagnostic centers, services availed during the special consultation service from the JDWNRH, and traditional and Rimdu/Puja activities. Employers either purchase insurance premiums for their employees, reimburse the health expenditure of their employees or maintain their health centers. Few NGOs also receive grants from the government or development partners for the delivery of health-related activities. There are hospitals financed and managed by the Indian Military Training Team (IMTRAT) and the project DANTAK working in Bhutan. These hospitals provide health services to Bhutanese in addition to their employees.

Flow of Fund

Subsequently, health facilities remits back the user fees to MOF.

2. METHODOLOGY

The NHA exercise was carried out using the System of Health Accounts 2011 (SHA 2011) guidelines. The data was analyzed using the Health Account Production Tool (HAPT) (V4.0.0.6).

2.1 Financial Years and Classifications

This study covers two fiscal years (2018/19 and FY 2019/20). Bhutan follows the June to July financial year cycle. In line with the SHA 2011 guideline, 13 financial classifications were chosen for the exercise. These include:

- 1. Institutional Units Providing Revenues to Financial Schemes -FS.RI
- 2. Revenues of Health Care Financing Schemes FS
- 3. Financing Schemes HF
- 4. Financing Agents -HA
- 5. Health Care Providers -HP
- 6. Health Care Functions HC
- 7. Factors of Health Care Provision-FP
- 8. Sub National SNL
- 9. Age -AGE
- 10. Gender -GENDER
- 11. Classification of diseases / conditions -DIS
- 12. Capital Account- HK
- 13. Traditional Complementary and Alternative Medicine (TCAM)

The generic HF and HP classifications were further expanded to add subgroups to represent the respective characteristics of the Bhutan health financial system. Other classifications were not changed and used with default subgroups.

2.2 Data Sources

The data sources for the parameter used are given in Table 1.

Parameters	Source
Government Health Expenditure	Ministry of Finance (MoF) and Ministry of Health (MOH)
Health Services	HMIS and JDWNRH
Donor Expenditure	Donor Crediting Reporting system
Health Expenditure by NGO	CSO Authority
Corporate health expenditure	Druk Holding Investment (DHI)
Household Health Expenditure	BLSS 2017
Insurance	RICBL

Table 1: Parameters and Data Source

Government Health Expenditure included both recurrent and capital expenditures categorized according to standard accounting classifications. The government expenditure was sufficient to recognize classification codes related to FSRI, FS, HF, FA, HP, SNL and FP classifications.

The morbidity data for all health facilities except JDWNRH was obtained from the HMIS, MoH. The data for JDWNRH was collected separately from JDWNRH since it is not reported to the HMIS.

OOPS related to transport costs incurred during routine hospital visits and ritual (Rimdo and Puja) were not considered for estimating the health accounts as this practice does fall within the health care boundary definition according to SHA 2011 . However, the transport cost for emergency medical care was included in the OOPS estimates.

2.3 Data Processing and import

The healthcare expenditure data collected were sorted and cleaned using the excel sheet. Under each expenditure line, qualitative information is required for recognizing the membership in respective classification categories and codes related to FSRI, FS, HF. FA, SNL, FP, and HP were also entered. In addition, special coding columns were maintained to facilitate the repeat mapping procedures, where relevant. Once processed, double-checking for coding consistencies was carried out and then these data files were imported into

HAPT under relevant data sources and actors. The total expenditures and other descriptive data related to Donor, NGO, Employer, Insurance, and Household were organized in the excel sheets and imported as the secondary data. None of the expenditure data were collected using the survey form of HAPT. All the data were imported to the HAPT tool for analysis.

2.4 SHA 2011 and HAPT Tool

System of Health Accounts 2011 is a collection of standards, definitions, and guidelines for producing NHAs. SHA 2011 facilitates the production of comparable health accounts across countries and between different periods in the same country. SHA 2011 principles comprise three dimensions; Consumer Interface, Provider Interface and Financing Interface.

HAPT is a public domain windows-based software program used to systematically digitalize health account details and produce various health account reports. HAPT is designed to be used with SHA 2011 guidelines and has inbuilt classifications that can be customized to represent specific country contexts. Users of HAPT can determine the classifications to be used in the country and identify data sources. Data from various sources can be gathered, processed, and entered into the HAPT. This will enable a process called "mapping" to collate these data by different SHA classification characteristics. Successful completion of mapping allows the creation of tables and graphs related to health accounts.

This is the Third NHA study conducted in the country using SHA 2011 guidelines. Similar NHA studies have been done previously for FYs 2014/15 & 2015/16 and FYs 2016/17 & 2017/18.

2.5 Data mapping

The nature of data record arrangement in the government health system enabled the identification and direct coding of FSRI, FS, and HF. FA, SNL, FP, and HP classifications in most expenditure files. Mapping of HC, Age, Gender, and disease classifications were carried out using disease keys derived based on morbidity statistics.

The morbidity data were available for each government institution separately and they were disaggregated by dzongkhag, type of institution, type of care within an institution (inpatient, outpatient, and preventive), age, sex and disease. These morbidity data files were used to compile three national master files, each for outpatient care, inpatient care, and preventive care. Each master file presented data on the number of patients under each disease condition and further subcategorized under 10 age-sex categories (5 age and 2 sex categories). Also, the information was retained so that these data files could be filtered by districts and types of institutions.

The adjustment was made to these files to standardize the number of patients in outpatient and preventive master files so that they are comparable, by expenditure wise, with the number of cases in the inpatient data file. These adjusted master files included the inpatient equivalents of the number of outpatient and preventive care patients. A cost study carried out in Bhutan (MoH, 2011), indicated cost ratio between different types of health care functions (inpatient, outpatient costs- per patient) across different types of health institutions (Referral, district, BHU, etc.). These cost ratios were used to convert the number of outpatient and preventive care patient visits into inpatient equivalents. This was achieved by multiplying respective data lines in master files by respective cost ratios.

These standardized values were subsequently used to calculate mapping keys related to Disease, HC, Age, and Gender classifications. Excel pivot tables were used to create relevant proportions.

Separate age-based mapping keys were created for out-patient, in-patient, and preventive care in different health care providers. These keys were based on the standardized total patient days under each age class in a particular type of care and provider. The age categories of preventive care components were directly allocable.

The classification for gender was separately created for each age category under different types of providers. It was also based on the total standardized patient days assigned for male and female patients under each provider, function, and age category.

Similarly, classification of diseases was also based on the total standardized patient days assigned for each disease. However, separate disease keys were created based on the type of provider.

The cost of consumption of fixed capital in government institutes was estimated in the following manner:

- Consumption of fixed capital (CFC) for buildings, vehicles, and equipment (Medical and other) and furniture belonging to the MoH were calculated for each year. The number and types of capital items that prevailed during the 2 financial years were listed by reviewing annual health bulletins and other relevant reports.
- ii) Then for each year, annualized capital cost (CFC) for corresponding items was calculated.

Annualized capital cost was based on the following formula (4):

CFC = (**RC** it / Annualization factor it)

Where

CFCit = Consumption of Fixed Capital of infrastructure item i in year t) RC it = Replacement cost of infrastructure item i at the end of year t = (Present cost * (1+ real r)

Real r = real interest rate = $\{[(1+nominal interest rate)/(1+annual inflation)]-1\}$

Annualization factor = $(1/r) \times [1 - (1/(1+r)n)]$:

where; r = real interest rate, n = life span of the infrastructure.

The real interest rate was calculated using the nominal interest rates and inflation rates in Bhutan of each year. The lifespan of a building was set at 60 years while those fototalr vehicles and equipment were assumed to be 10 and 5 years respectively.

Household expenditure data for FY 2018/19 and FY 2019/20 were estimated by forecasting these amounts based on the BLSS survey data in 2017. Initially, outpatient, delivery, and inpatient per capita health expenditures incurred by Bhutan people in 2017 were estimated. This was accomplished by analyzing the original data using STATA software. The estimates for future years were obtained by calculating the respective national estimates based on the per-capita expenditures (inflated for annual inflation) and estimated national populations. BLSS survey data also included data on background variables such as age, sex, etc.. so that adequate filtration of estimates could be carried out when finding out the percentages of the relevant cost required for creating age, genderrelated distribution keys. Data also provided provider information, and health care function so that distribution keys for HP, HC, DIS classifications could be derived.

Donor data were mainly retrieved from the government expenditure reports. Donor data was also supplemented by the reports directly obtained from Donors and the CRS database. These records contained adequate information to identify FSRI, FS, HF, FA, FP, and HC classifications. In some cases of donor expenditures related to preventive care SNL, age and gender coding were not available. Hence, it was assumed that these funds for which data were not available, were mostly aimed at overall population preventive work. Hence, they were mapped using distribution keys created based on national population characteristics.

Coding for FSRI, FS, HF, FA for employer data was implied from the nature of the information. No details on coding related to FP, HC, and HP classifications were available. Therefore, they were coded into respective unidentified categories. The overall distribution keys derived from the SNL, Age, Gender, and disease cost distributions of government data were used for coding employer data on SNL, Age, gender, and disease classifications. It was assumed that SNL, Age, Gender, and disease patterns among employees who fall ill would also be similar to the normal population, who fall ill.

Insurance data allowed the direct identification of FSRI, FS, HF, FA classifications based on context. FP, HP, and HC classification were classified as non-specific due to lack of identification data. RICB data had adequate information to develop SNL-based distribution keys.

No specific data available for mapping NGO expenditures into HC, HP, FP classifications, and hence they were assigned to n.e.c (unspecified) categories. SNL, age, gender classifications were assumed to be equal to national population distributions related to these criteria.

2.6 Data validation and report production

After following the above estimation techniques, data file preparations, and data entering activities and mapping, the NHA accounts were generated in the HAPT. Then data files imported in the HAPT were perused to check for completeness of data under all actors of the health financing system. The data maps of each data

source were checked for completeness to ensure all entered files were mapped. The preliminary results were validated for consistency and accuracy after which report was produced.

3. RESULTS AND DISCUSSIONS

3.1. Overall Health Expenditure

The total health expenditure (sum of CHE and CF) during the FY 2018/19 was approximately Nu. 7212 mn and that for the FY 2019/20 was Nu. 8705 mn which accounts to 4% and 4.5% of the GDP in the respective financial years. The total Current Health Expenditures (CHE) for FY 2018/19 and FY 2019/20 was around Nu. 6233 million (mn) and Nu. 7656 mn, respectively. These amounts include the expenditures made by government, corporate and household during respective fiscal years including the cost of capital assets consumption in the government health system. The sum of CHE borne by the Royal Government of Bhutan (RGoB) was 3 % of the Gross Domestic Product (GDP).

3.2. Current Health Expenditure and Capital Formation

The total CHE for the FY 2018/19 and 2019/20 were Nu. 6,233,340,873 and Nu. 7,656,293,990, respectively. The CHE increased by 17% in 2018/19 compared to 2017/18, and 22% in 2019/20 from the previous FY. The trend shows there was an exponential increase of CHE over the recent years.

The capital formation for FY 2018/19 was estimated Nu. 978,605,495, while in FY 2019/20 it was around Nu. 1,048,422,566. On average, the cost of capital formation in the last six years remained around one billion Ngultrums.

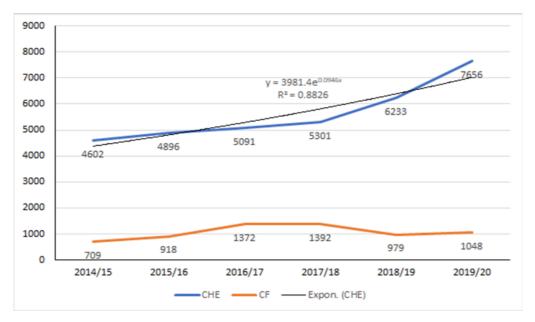

Figure 2: Trends in CHE and CF in Bhutan Between FY 2014/15 to FY 2019/20

3.3. Health Expenditures as a percentage of GDP

The CHE from the RGOB as a percentage of GDP was 2.7% in 2018/2019 and 3.2.% in FY 2019/2020, and the total health expenditures (CHE+CF) were 4% and 4.5% of GDP in 2018/19 and 2019/20, respectively as given in the Table 2.

Table 2: GDP, Health Expenditure Types, and Their Relative Sizes in Relation to GDP in FY 2018/19 and FY 2019/20

Indicator	FY 2018/19	FY 2019/20
GDP (Nu)*	178,201,890,000	192,309,624,722
CHE (Nu)	6,233,340,873	7,656,293,990
CHE RGoB (Nu)	4,803,742,128.28	6,136,965,439.33
CF (Nu)	978,605,495	1,048,422,566
Total (CHE +CF)	7,211,946,368	8,704,716,556
CHE as % of GDP	3.5%	4.0%
CHE RGoB as % of GDP	2.7%	3.2%
Total (CHE +CF) as a % of GDP	4.0%	4.5%

Source: National Accounts Statistics 2020, National Statistical Bureau, Bhutan

3.4. Per Capita Health Expenditures in FY 2018/19 and FY 2019/20

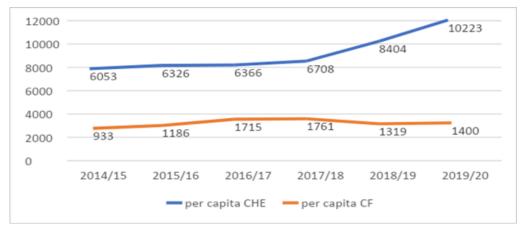

There was an increase in both per-capita CHE and per-capita CF in 2019/20 compared to the previous FY as given in Table 2.

Table 3. Per ca	nita Health	Expenditure	During 1	FY 2018/19	and FY 2019/20
	pha meann	Lapenditure	During	1 2010/17	and 1 1 2017/20

Indicator	FY 2018/19	FY 2019/20
Per capita CHE (Nu)	8,404.44	10,222.96
Per capita CHE RGoB (Nu)	6,476.91	8,194.30
Per capita CF (Nu)	1,319.46	1,399.89
Per capita Total (CHE +CF)	9,723.90	11,622.86

The following figure shows the trend in per-capita CHE and CF over the last

Figure 3: Per-capita CH & CF from FY 2014/15 to FY 2019/20 (Nu)

3.5. CHE by Consumer Interface

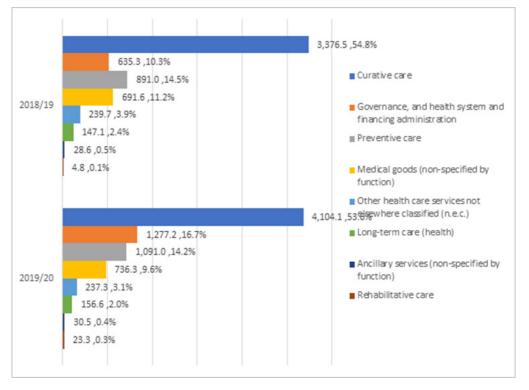

This section presents the CHEs disaggregated by healthcare functions, age, gender, disease and geographical distribution in the two financial years: FY 2018/19 and FY 2019/20.

3.5.1 CHE by Health Care Functions

The Health care functions disaggregate CHE by the type of health care needs such as costs of preventive care, governance, health system and financing administration, and other non-specified expenditures (Figures 4 and Table 3).

Amongst the healthcare functions, the largest share of CHE was spent on the curative care services, which accounted for 54% of total CHE in both FY 2018/19 and 2019/20. The curative cost also includes the hospital administrative cost. The CHE for preventive care expenditures were found to be around 14 % in both financial years. The central administration costs were estimated at 10% and 16.7% in FY 2018/19 and 2019/20 respectively. Around 11 % and 9.6% of CHE was spent on the medicines and other medical goods non specified by function in FY 2018/19 and 2019/20 respectively. However, the CHE spent on the ancillary services non specified by functions (i.e. for laboratory services and patient transport in acute emergencies), rehabilitation and long-term health care was relatively small¹.

Figure 4: Distribution of Amount (Nu. Mn) and % of CHE in FY 2018/19 and FY 2019/20 by Health Care Functions

¹ The ancillary services include privately purchased services like laboratory investigations, patient transportation, and medical goods non-specified by function. Medical goods non-specified by function include privately purchased pharmaceuticals and other medical goods that were not included in the curative care packages given by the public health facilities. It is important to note that the costs of laboratory investigation, ambulance, and pharmaceutical costs associated with institutionalized care are factored into respective curative care component costs and thus do not get reflected under ancillary care and medical goods categories.

Table 4: Distribution of Amount (Nu.) and % of CHE in FY 2018/19 and 2019/20 by Healthcare Functions

3.5.2. CHE by Age

The largest share of CHE was in the age group of 20-59 which was around 55% for both the FYs. This could be attributed to the relatively larger representation of this age group in the Bhutanese population structure. Further, close to 18% of CHE was spent on the health care provision for children.

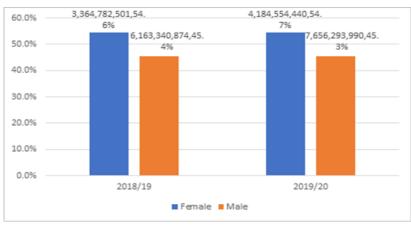

Age		2018/19		2019/20		
		Amount (Nu.)	%	Amount (Nu.)	%	
AGE.1	< 5 years old	1,104,550,731	17.9%	1,419,132,205	18.5%	
AGE.2	5 to 14	586,596,763	9.5%	731,854,367	9.6%

All AGE		6,163,340,874	100.0%	7,656,293,990	100.0%	

Table 5: CHE in FY 2018/19 and 2019/20 by Age

3.5.3. CHE by Gender

The CHE by gender was estimated based on the gender wise health-seeking data acquired from the HMIS. Figure 5 shows the gender-based disaggregation of CHE in the FY 2018/19 and 2019/20. In both years, a relatively larger share of CHE was assigned for females which suggests that health services are largely gender responsive.

Figure 5: Percentage Distribution of CHE in FY 2018/19 and FY 2019/20 by Gender

3.5.4. CHE by Illnesses

Figure 6 and Table 6 presents the share of CHE by disease groups as per the Global Disease Burden classification indicated in SHA 2011. The method of cost allocation for illnesses is described in the methodology section. The largest share of CHE in both the FYs was expended on non-communicable diseases (37.9% in 2018/19 and 40.7% in 2019/20) followed by reproductive health care (22.8% in 2018/19 and 21.6% in 2019/20) and infectious diseases (18.7% in 2018/19 and 19.1% in 2019/20).

3.5.5. CHE by Dzongkhag

The CHE at dzongkhag levels were estimated by linking the healthcare cost to the place of expenditure. However, the cost for preventive interventions was determined by considering the specific geographical areas where the interventions were targeted. Cost of medical supplies centrally done was apportioned to the Dzongkhags based on the annual indent records of the respective facilities.

The analysis showed Thimphu with the highest CHE followed by Sarpang, Mongar, and Chukha. This can be attributed to the healthcare expenditure incurred by major hospitals³ which are located in these districts.

³ JDWNRH in Thimphu is 350 bedded; CRRH in Sarpang & ERRH in Mongar are 150 bedded; Phuntsholing general hospital in Chukha is 60 bedded.

Table 7: CHE in FY 2018/19 and 2019/20 by Regions and Dzongkhags

3.6. CHE by Provider Interface

This section presents the analysis of CHE by provider institutions and factors of provision.

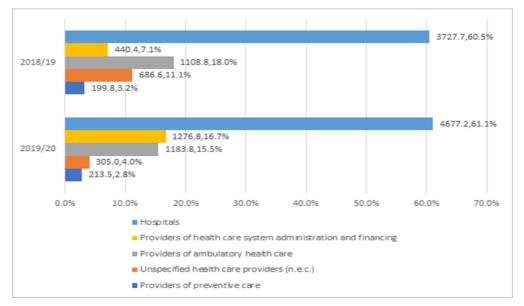

3.6.1. CHE by Providers

The SHA 2011 has classified health care providers as hospitals (general and specialized), providers of ambulatory health services, retailers and other providers of medical goods, providers of preventive care, providers of health system administration and financing, and the rest of the economy.

Figure 7 and Table 8 presents the CHE in FY 2018/19 and 2019/20 by various health care providers in Bhutan. Hospitals were found to be the most cost-consuming health care providers in both years. It reflects relatively higher needs for curative care needs, as well as relatively higher expenses associated with curative care provision.

Approximately 60.5% and 61% of CHE in FY 2018/19 and 2019/20 were used by all the hospitals in Bhutan. The largest percentage (nearly 31 %) of hospital costs were used by the Dzongkhag level hospitals and BHUs. Expenditure of JDWNRH accounted for around 21 % of CHE in both financial years.

Table 8: CHE in FY 2018/19 and 2019/20by Health Care Providers

3.6.2. CHE by Factors of Provision

Disaggregation of CHE by factors of provision allows us to understand the distribution of current health expenses on various constituents of production. They include expenditure incurred for paying compensations for employees in the health system, cost of drugs and other medical goods, cost of non-health care services, and cost of consumption of fixed capital in the government health system.

Figure 8 and Table 9 present the disaggregation details of CHE in financial years 2018/19 and 2019/20 by factors of provision.

The largest share (nearly 40%) of CHE in both FY 2018/19 and 2019/20 were spent on purchasing material and services related to health care. The second-largest share (29% to 36%) was attributed to the compensation of employees in both years.

Figure 8: Percentage Distribution of CHE in FY 2018/19 and FY 2019/20 by Factors of Provision

3.7. CHE by Financial Interface

Analysis of CHE by health financing dimensions describes the flow of funds related to health care from various fund providers⁴ until they are finally utilized to purchase or produce healthcare services.

The general government revenue is allocated to the various government institutions which provide health care services. In Bhutan, all donor funds to NGOs are also channeled through government revenue mechanisms. In addition, household expenses related to healthcare are incurred on direct payments for availing private healthcare services and purchasing primary insurance schemes. For Corporations, the funds are channeled through two revenue mechanisms which includes voluntary insurance prepayment from employers that covers the reimbursement of healthcare bills of employees, and other revenues from corporations n.e.c. that covers the maintaining of workplace-based healthcare delivery points.

Fund's sourced from the rest of the world are mostly distributed by the government through the revenue mechanism called 'Transfers Distributed by Government from Foreign Origin'. The remaining portion of the funds sourced from the Rest of the World is included as 'Direct Foreign Transfers'.

The government financing scheme consists of the Ministry of Health and Dzongkhag. The revenue mechanisms of these financing schemes are depicted in Figure 9. The financing schemes related to private health expenditures have direct correspondence with the respective revenue mechanisms. Clear one-to-one correspondence is observed between the health financing schemes and financing agents.

⁴ The funds providers refer to the institutional units providing revenues to financing schemes - (FSRI), using various revenue mechanisms (Revenues of Financing Schemes -FS), financing arrangements (Health Financing Schemes -HF), and financing agents (Financing Agents -FA)

Institutional units providing revenues to financing schemes (FS.RI)	Revenues of Financing Schemes (FS)	Health Financing Schemes (HF)	Financing Agents (FA)

3.7.1. CHE by Institutional Units Providing Revenues to Financing Schemes

Institutional Units Providing Revenues to Financing Schemes refers to the different sources of funds that are allocated to and spent on health care services in the country. The principal share (70% to 74% in respective FYs) of CHE was provided by the government. Households provided 18% and 15% total CHE in FY 2018/19 and 2019/20 respectively. Donor contribution was relatively small (7% to 5%) in FY 2018/19 and 2019/20 respectively.

Table 10 : CHE in FY 2018/19 and 2019/20by Institutional Units Providing Revenues to Financing Schemes

3.7.2. CHE by Revenues of Health Care Financing Schemes

Given the higher percentage of government contribution to CHE, the main revenue mechanism of CHE in both FYs has been the transfers from government domestic revenue constituting 73% to 78% in two financial years respectively. The second-largest revenue was from households⁵, 18% and 15% in FY 2018/19 and 2019/20 respectively. Other domestic revenues included revenues from households, corporations, and a few nonspecific sources as indicated in Table 11.

⁵ The household expenditures (OOPS) reported in this report excludes non-emergency transport costs and expenditures made on the rituals(Rimdo and Puja). Cost borne for emergency transport activities was factored in the OOPS. Rimdo and Puja expenditures were excluded as this practice does not fall within the health care boundary definition according to SHA 2011.

Table 11: CHE in FY 2018/19 and 2019/20 by Revenues of Healthcare Financing Schemes

3.7.3. CHE by Financing Schemes

Financing of the Government health sector was attained through two major financial schemes, namely MoH Scheme and Dzongkhag Health Scheme.

Government schemes managed approximately 77% and 80% of CHE in FY 2018/19 and 2019/20 respectively. The central government scheme covered expenditures related to MoH, JDWNRH, Regional Referral hospitals and three hospitals under MoH's administration, and those of autonomous institutions

while the Dzongkhag health scheme handled 17% to 19%. Household out of pocket payments schemes accounted for nearly 18% and 15% of CHE in FY 2018/19 and 2019/20 respectively. Voluntary health care payment schemes that included health care insurance expenditures incurred by employers and private individuals, covered only a less than 2% share of CHE.

					2018/19)	2019/2	0

3.7.4. CHE by Financing Agents

The government was a principal financing agent in both FY 2018/19 and 2019/20. On average 77 % to 80 % of CHE was managed by the Government in FY 2018/19 and 2019/20 respectively. Table 13 presents the distribution of CHE by financing agents.

Table 13: CHE Trend	by Financing Agents
---------------------	---------------------

Financing Agent	2016/17	2017/18	2018/19	2019/20
Government	79.10%	83.60%	76.70%	80.10%

Rest of the world	6.40%	1.80%	3.50%	3.00%
	100 %	100 %	100 %	100 %

4. LIMITATIONS

Due to COVID-19 pandemic, it was difficult to collect the latest morbidity data. However, NHA team found that the disease trends in the hospital system have not changed significantly from the previous data patterns. Therefore, it was decided to use the disease mapping rules used in the 2017/18 NHA study in this study as well.

There were no reports or CRS records available for the donor's direct expenditures for the FY 2019/20. Therefore, direct donor expenditures were estimated by adding escalated amounts based on inflation. Considering that direct donor expenses were not consistent during the previous NHA exercises, no attempts were made to extrapolate these expenditure elements based on past trends for this study.

According to the previous NHA experience, obtaining NGO expenditure was difficult due to poor responses. Further, the amounts reported were not so consistent across years. Therefore, a considerable variation was observed in the NGO expenditures between the past 4 NHAs reports. Though imputations were made during past NHAs to estimate the expenditures of non-reporting NGOs, the accuracy may have been affected as it was based on the averages of reported NGOs. Hence, NHA team for this study made strenuous attempts to obtain NGO-related health expenditure by one-to-one canvassing. This effort has produced positive results as indicated by a relatively higher (84%) amount of NGO-related health expenditures in the FY 2018/19 compared to the previous NHAs. This may probably represent a better recording than the increase of actual NGO-related health expenditures during these 2 financial years. It was estimated that NGO reported 14% higher in the FY 2019/20 compared with FY 2018/19. Similarly, reporting from insurance-based health expenditure increased by 57% in FY 2018/19 as compared to FY 2017/18. However, there was a 6% decline in the health insurance expenditures of the FY 2019/20. There were no other sources for cross-checking the reasons for these escalations observed in insurance expenditures. Smoothing was also not considered as the expenditures were directly reported from the only insurance department's reports.

5. CONCLUSION

In keeping with the constitutional mandate to provide free health services, the government remains a primary source of financing the health system. More than 80% of the total spending for health is contributed by the government. Despite predominant financing from the government, out of pocket spending remains a concern . The contribution from other sources is low but complements the government in financing the health care services. The Post Development Agenda of Sustainable Development Goals recommends using health financing to monitor progress towards Universal Health Coverage. Therefore, NHA exercise produces necessary evidence on health spending as a key input for health policy and planning, and to support the achievement of national and international health goals.
